

Vishal Yadav Portfolio - Owner's Guide

A complete handbook for running, updating, and handing off this website. No prior coding knowledge required for the content edits in Section 4.

Project location on this PC:

C:/Users/vy355/.claude/vishal-portfolio

Tech stack: Next.js 16, React 19, TypeScript, Tailwind CSS v4, Framer Motion.

1. How to run the project (manually)

You use Windows, so open Command Prompt: press the Windows key, type cmd, press Enter.

Then copy-paste these two lines:

```
cd /d C:\Users\vy355\.claude\vishal-portfolio
npm run dev
```

Wait until it prints "Local: http://localhost:3000", then open that address in your browser.

To STOP the server: click the black cmd window and press Ctrl + C.

First time on a new computer (or if you see "module not found"), run this once first:

```
cd /d C:\Users\vy355\.claude\vishal-portfolio
npm install
```

Easiest alternative - VS Code:

- Open VS Code, File menu, Open Folder, choose the vishal-portfolio folder.
- Open the terminal with Ctrl + backtick (the key above Tab).
- Type: npm run dev
- Ctrl+click the http://localhost:3000 link.

Common mistakes:

- Running "cd vishal-portfolio" from C:/Users/vy355 fails. The project is INSIDE the .claude folder, so always use the full path above.
 - Do not paste any "# http://..." comment text. cmd does not understand the # symbol.
 - If port 3000 is busy it will use 3001 - just open whatever URL it prints.
-

2. Project structure (where everything lives)

You will mostly touch the files inside the src folder.

vishal-portfolio/	
public/	images and the resume file
resume.pdf	the downloadable resume
images/profile.jpg	your photo (optional, drop it in)
images/projects/	project cover images (optional)

```
src/
lib/
site.ts          name, email, phone, social links
data/projects.ts all projects
data/skills.ts   all skills
data/certifications.ts all certifications
app/
page.tsx         home page
about/page.tsx   About page (education, experience)
projects/page.tsx projects listing
skills/page.tsx  skills page
certifications/page.tsx certifications page
contact/page.tsx contact page
components/      reusable building blocks
home/stats.tsx   the 4 stat numbers on the home page
```

Rule of thumb: to change WORDS and DATA, edit the files in src/lib. To change LAYOUT, edit the files in src/app and src/components.

3. The golden rule for editing

1. Open the file in a text editor (Notepad works, VS Code is better).
2. Change the text inside the quotation marks " ".
3. Keep all commas, brackets [], and braces { } exactly where they are.
4. Save the file. If "npm run dev" is running, the browser updates automatically.

If the page goes blank after an edit, you probably deleted a comma or a bracket.
Undo with Ctrl + Z and save again.

4. How to update each section (no coding)

4.1 Name, email, phone, social links, resume name

File: src/lib/site.ts

Change the values inside the quotes:

```
name: "Vishal Yadav",
email: "vishalyadav.analytics@gmail.com",
phone: "+91 9619039381",
resumeFileName: "Vishal_Yadav_Resume.pdf",
links: {
  github: "https://github.com/Vishal123-tech",
  linkedin: "https://www.linkedin.com/in/vishal-yadav-339b9b1b5",
  kaggle: "https://www.kaggle.com/vishalinsightx",
},
```

4.2 Projects (add / edit / remove)

File: src/lib/data/projects.ts

Each project is a block between { and }. To EDIT one, change the text in quotes.
To ADD a new project, copy an entire existing block (from { to },) and paste it,
then change the values. To REMOVE one, delete its whole block.

Field meanings:

- slug: the web address part, lowercase-with-dashes, must be unique.
- title: project name shown everywhere.
- tagline: one-line summary on the card.
- category: must be one of "Data Analysis", "Machine Learning", "Dashboard", "SQL".
- year: e.g. "2026".
- featured: true shows it on the home page, false hides it from home.
- tech: the technology tags, e.g. ["Python", "SQL", "Power BI"].
- illustration: which built-in graphic to show. One of "ml", "sql", "powerbi", "dashboard".
- githubUrl: the "View code" button link.
- overview, features, challenges, results, resultNarrative, architecture, screenshots:

the content shown on the project detail page.

Minimal new-project template:

```
{
  slug: "my-new-project",
  title: "My New Project",
  tagline: "One line about it.",
  category: "Machine Learning",
  year: "2026",
  featured: true,
  tech: ["Python", "Pandas"],
  illustration: "ml",
  githubUrl: "https://github.com/Vishal123-tech/my-new-project",
  overview: "A longer paragraph describing the project.",
  features: ["First feature", "Second feature"],
  challenges: ["A challenge you solved"],
  results: [
    { label: "Accuracy", value: 90, suffix: "%" },
    { label: "Records", value: 5000, suffix: "+" }
  ],
  resultNarrative: "What the outcome was.",
  architecture: [
    { step: "Collect", detail: "Gather data" },
    { step: "Model", detail: "Train the model" }
  ],
  screenshots: [{ caption: "Result chart" }]
},
```

If you add an image cover, put the file in public/images/projects/ and add this line inside the project: cover: "/images/projects/your-file.png".

Note about the category filter: clicking a category on the Projects page shows only projects whose category matches. "All" shows everything.

4.3 Skills

File: src/lib/data/skills.ts

Skills are grouped. Inside each group, the skills list looks like:

```
{ name: "Python", level: 90 },
```

level is 0 to 100 and controls the length of the colored bar. Add or remove lines, keeping the same format and the comma at the end.

4.4 Certifications

File: src/lib/data/certifications.ts

Each certification block:

```
{  
  title: "Machine Learning for Data Science Projects",  
  issuer: "IBM SkillsBuild",  
  date: "Mar 2026",  
  sortKey: 202606,  
  skills: ["Machine Learning", "Python"],  
},
```

issuer must be one of "IBM SkillsBuild", "Google", "Deloitte" (to add a new issuer, ask an AI or developer to extend the allowed list and its color).
sortKey orders the timeline - bigger number = shown higher (use YYYYMM, e.g. Mar 2026 = 202603).

4.5 About page (education, experience, objective)

File: src/app/about/page.tsx

- education: the school/college list (newest first).
- journey: the experience and milestone timeline.
- The career-objective paragraph and the location text are also in this file - search for the words to find them.

Education entry format:

```
{  
  period: "Mar 2023 - May 2027",  
  title: "B.E. - Electrical, Electronics & Communications Engineering",  
  subtitle: "Shree L. R. Tiwari College of Engineering, Mumbai",  
  description: "Optional extra line.",  
},
```

4.6 Home page stat numbers

File: src/components/home/stats.tsx

The 4 big numbers near the top. Each one:

```
{ label: "Featured projects", to: 2 },
```

```
{ label: "Technologies & tools", to: 20, suffix: "+" },
```

to is the number it counts up to. suffix adds text like "+" or "%".

4.7 Replace the resume file

Put your latest PDF at public/resume.pdf (overwrite the existing file). Keep the name exactly "resume.pdf". Every Download Resume button uses it automatically.

4.8 Add your photo

Save a square photo as public/images/profile.jpg. It appears on the About page automatically. If absent, a placeholder shows.

5. See your changes / check it still works

- While "npm run dev" is running, saving a file refreshes the browser instantly.
- To confirm everything is healthy before publishing, run:

```
npm run build
```

If it ends without "Failed", you are good. If it shows an error, read the file name and line number it mentions, undo your last edit, and try again.

6. Save your changes to GitHub

The GitHub remote is already set up. After editing, run:

```
cd /d C:\Users\vy355\.claude\vishal-portfolio
git add -A
git commit -m "Update content"
git push
```

The first push opens a browser window to log in to GitHub - approve it once.

If the repository does not exist yet, create an empty one named vishal-portfolio at <https://github.com/new> (owner Vishal123-tech, do not add a README), then push.

7. Put it online (Vercel)

1. Go to <https://vercel.com/new> and import the vishal-portfolio GitHub repo.
2. Click Deploy. No settings needed.
3. After it is live, open src/lib/site.ts and set url to your real address, e.g. url: "https://vishal-yadav.vercel.app", then commit and push again.

Or from the folder: `npm i -g vercel`, then `vercel --prod`.

8. Updating with an AI assistant (new Claude session, ChatGPT, Gemini)

You can use any AI to make changes. Do this:

1. Open the project folder so you can see the files.
2. Tell the AI which file you want changed (see Section 2 and 4 for the file).
3. Paste the current contents of that file, and this important note:

IMPORTANT: This project uses Next.js 16 and Tailwind CSS v4 (newer than most training data). Only change the data/text I ask for. Keep all commas and brackets valid. Do not change the build setup.

Ready-to-paste prompt template:

```
I have a Next.js 16 + TypeScript portfolio. I want to [describe your change,
e.g. "add a new project called X"]. The relevant file is src/lib/data/projects.ts.
Here are its current contents:
```

```
[paste the file here]
```

```
Please give me the full updated file. Keep the existing format, commas, and
brackets
valid. Do not change anything else.
```

4. Copy the AI's updated code back into the file, save, and run `npm run dev` to check.

Tip: Claude Code (the tool that built this) can open the whole folder and edit files directly - that is the smoothest option. ChatGPT/Gemini work too, but you copy-paste files in and out by hand.

9. Notes for a full-stack developer

- Framework: Next.js 16 (App Router, Turbopack), React 19, TypeScript strict mode.
- Styling: Tailwind CSS v4. Design tokens and custom utilities are in `src/app/globals.css` (CSS variables for both themes, `.gradient-text`, `.bg-grid`, `.glass`, etc.). Dark mode is class-based via `next-themes`.
- UI primitives: hand-rolled shadcn-style components in `src/components/ui` (button, card, badge, input, textarea) using `class-variance-authority`.
- Animations: Framer Motion. Note ease arrays must be typed as `Variants` or the build fails (TS), and brand icons are custom SVGs in `src/components/icons.tsx` because `lucide-react` removed its brand icons in this version.
- Content is fully data-driven: `src/lib/site.ts` and `src/lib/data/*`. Pages map over that data, so adding items rarely needs component changes.
- SEO: metadata in `app/layout.tsx` and per page; `app/sitemap.ts`, `app/robots.ts`, and a dynamic OG image at `app/opengraph-image.tsx`.
- Scripts: `npm run dev`, `npm run build`, `npm start`, `npm run lint`.

- Project detail uses generateStaticParams + generateMetadata (params is a Promise - await it). All routes are static/SSG.
-

10. Troubleshooting / FAQ

- "The system cannot find the path specified" -> you are not in the project folder.

Use: `cd /d C:\Users\vy355\claude\vishal-portfolio`

- "module not found" / "next is not recognized" -> run `npm install` once.
- Page is blank or build fails after an edit -> you removed a comma or bracket.

Undo with `Ctrl + Z`, save, try again.

- Port 3000 busy -> Next.js uses 3001 automatically; open that URL.
 - Resume downloads as `resume(1).pdf` -> harmless browser behavior when the file already exists in Downloads; the name is set to `Vishal_Yadav_Resume.pdf`.
 - Changes not showing -> hard refresh the browser with `Ctrl + Shift + R`.
-

Made for Vishal Yadav. Keep this file in the project folder for reference.
